System Used to Develop the Program

Faced Challenges

Multiple computers need to be setup to see if the program runs as expected. After the setup, if a part of the code needs changing all the devices need to be updated as well. This made testing somewhat cumbersome and slow.

A lot of research went into a certain problem that was appearing on Windows computers, unfortunately couldn't solve it.

Know Limitations

Doesn't work on Windows devices (IP Address Invalid in Its Context Error). If a chunk's size is divisible by the buffer size P2P_Downloader might consider download to have failed.
